Workshop on Algorithms in Bioinformatics, 2006

#### **Outline**

Introduction

- Introduction
  - The Model and the Problem
  - The Integrated Approach
- **Bad News: Hardness Results** 
  - Hardness of PP-Partitioning of Haplotype Matrices
  - Hardness of PP-Partitioning of Genotype Matrices
- 3 Good News: Tractability Results
  - Perfect Path Phylogenies
  - Tractability of PPP-Partitioning of Genotype Matrices

The Model and the Problem

Introduction

#### What is haplotyping and why is it important?

You hopefully know this after the previous three talks. . .

Good News: Tractability Results

The Model and the Problem

#### General formalization of haplotyping.

#### **Inputs**

- A genotype matrix G.
- The rows of the matrix are taxa / individuals.
- The columns of the matrix are SNP sites / characters.

#### **Outputs**

- A haplotype matrix H.
- Pairs of rows in H explain the rows of G.
- The haplotypes in H are biologically plausible.

The Model and the Problem

# Our formalization of haplotyping.

#### Inputs

- A genotype matrix G.
- The rows of the matrix are individuals / taxa.
- The columns of the matrix are SNP sites / characters.
- The problem is directed: one haplotype is known.
- The input is biallelic: there are only two homozygous states (0) and 1) and one heterozygous state (2).

#### **Outputs**

- A haplotype matrix H.
- Pairs of rows in H explain the rows of G.
- The haplotypes in H form a perfect phylogeny.

#### We can do perfect phylogeny haplotyping efficiently, but ...

- Data may be missing.
  - This makes the problem NP-complete ...
  - ... even for very restricted cases.

#### Solutions:

- Additional assumption like the rich data hypothesis.
- 2 No perfect phylogeny is possible.
  - This can be caused by chromosomal crossing-over effects.
  - This can be caused by incorrect data.
  - This can be caused by multiple mutations at the same sites.

#### Solutions:

- Look for phylogenetic networks.
- Correct data.
- Find blocks where a perfect phylogeny is possible.

#### How blocks help in perfect phylogeny haplotyping.

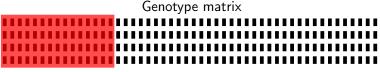

- Partition the site set into overlapping contiguous blocks.
- 2 Compute a perfect phylogeny for each block and combine them.
- Use dynamic programming for finding the partition.

Genotype matrix

no perfect phylogeny

#### How blocks help in perfect phylogeny haplotyping.

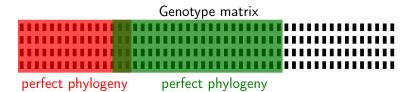

- Partition the site set into overlapping contiguous blocks.
- Compute a perfect phylogeny for each block and combine them.
- **3** Use dynamic programming for finding the partition.

perfect phylogeny

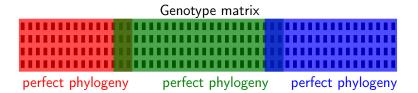

#### How blocks help in perfect phylogeny haplotyping.

- Partition the site set into overlapping contiguous blocks.
- 2 Compute a perfect phylogeny for each block and combine them.
- **3** Use dynamic programming for finding the partition.

#### How blocks help in perfect phylogeny haplotyping.

- Partition the site set into overlapping contiguous blocks.
- 2 Compute a perfect phylogeny for each block and combine them.
- **1** Use dynamic programming for finding the partition.

## Objective of the integrated approach.

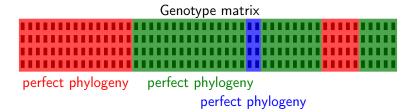

- 1 Partition the site set into noncontiguous blocks.
- 2 Compute a perfect phylogeny for each block and combine them.
- Ompute partition while computing perfect phylogenies.

Genotype matrix

no perfect phylogeny

# Objective of the integrated approach.

- Partition the site set into noncontiguous blocks.
- 2 Compute a perfect phylogeny for each block and combine them.
- Ompute partition while computing perfect phylogenies.

#### The formal computational problem.

We are interested in the computational complexity of the function  $\chi_{PP}$ :

- It gets genotype matrices as input.
- It maps them to a number k.
- This number is minimal such that the sites can be covered by k sets, each admitting a perfect phylogeny. (We call this a pp-partition.)

# Finding pp-partitions of haplotype matrices.

We start with a special case:

- The inputs *M* are already haplotype matrices.
- The inputs M do not allow a perfect phylogeny.
- What is  $\chi_{PP}(M)$ ?

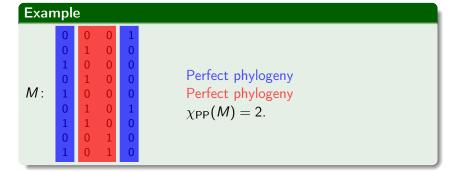

## **Example**

No perfect phylogeny is possible.

# Finding pp-partitions of haplotype matrices.

We start with a special case:

- The inputs *M* are already haplotype matrices.
- The inputs M do not allow a perfect phylogeny.
- What is  $\chi_{PP}(M)$ ?

### Bad news about pp-partitions of haplotype matrices.

#### **Theorem**

Finding optimal pp-partition of haplotype matrices is equivalent to finding optimal graph colorings.

#### Proof sketch for first direction.

- $\bigcirc$  Let G be a graph.
- ② Build a matrix with a column for each vertex of G.
- **3** For each edge of G add four rows inducing the submatrix  $\begin{pmatrix} 0 & 0 \\ 0 & 1 \\ 1 & 0 \end{pmatrix}$ .
- The submatrix enforces that the columns lie in different perfect phylogenies.

## Implications for pp-partitions of haplotype matrices.

#### **Corollary**

If  $\chi_{PP}(M) = 2$  for a haplotype matrix M, we can find an optimal pp-partition in polynomial time.

#### Corollary

Computing  $\chi_{PP}$  for haplotype matrices is

- NP-hard.
- not fixed-parameter tractable, unless P = NP,
- very hard to approximate.

# Finding pp-partitions of genotype matrices.

#### Now comes the general case:

- The inputs M are genotype matrices.
- The inputs M do not allow a perfect phylogeny.
- What is  $\chi_{PP}(M)$ ?

#### Example

No perfect phylogeny is possible.

1 0 0 0 0 0 0 1 0 0 1 0

# Finding pp-partitions of genotype matrices.

#### Now comes the general case:

- The inputs M are genotype matrices.
- The inputs *M* do not allow a perfect phylogeny.
- What is  $\chi_{PP}(M)$ ?

# 

### Bad news about pp-partitions of haplotype matrices.

#### **Theorem**

Finding optimal pp-partition of genotype matrices is at least as hard as finding optimal colorings of 3-uniform hypergraphs.

#### Proof sketch.

- Let G be a 3-uniform hypergraph.
- 2 Build a matrix with a column for each vertex of G.
- **3** For each hyperedge of G add four rows inducing the submatrix  $\begin{pmatrix} 2 & 2 & 2 \\ 1 & 0 & 0 \\ 0 & 1 & 0 \end{pmatrix}$ .
- The submatrix enforces that the three columns do not all lie in the same perfect phylogeny.

Good News: Tractability Results

#### Implications for pp-partitions of genotype matrices.

#### Corollary

Introduction

Even if we know  $\chi_{PP}(M) = 2$  for a genotype matrix M, finding a pp-partition of any fixed size is still

- NP-hard,
- not fixed-parameter tractable, unless P = NP,
- very hard to approximate.

Introduction

#### Automatic optimal pp-partitioning is hopeless, but...

- The hardness results are worst-case results for highly artificial inputs.
- Real biological data might have special properties that make the problem tractable.
- One such property is that perfect phylogenies are often perfect path phylogenies:
  - In HapMap data, in 70% of the blocks where a perfect phylogeny is possible a perfect path phylogeny is also possible.

Н

Perfect Path Phylogenies

Introduction

#### Example of a perfect path phylogeny.

#### Genotype matrix

B C

	2	2	2	
G:	0	2	0	
	2	0	0	
	_	_	_	

#### Haplotype matrix

	Α	В	С	
	1	0	0	
	0	1	1	
	0	0	0	
:	0	1	0	
	0	0	0	
	1	0	0	
	0	0	0	
	0	1	1	

# Perfect path phylogeny

Good News: Tractability Results

Introduction

#### The modified formal computational problem.

We are interested in the computational complexity of the function  $\chi_{\text{PPP}}$ :

- It gets genotype matrices as input.
- It maps them to a number k.
- This number is minimal such that the sites can be covered by k sets, each admitting a perfect path phylogeny.
   (We call this a ppp-partition.)

#### Good news about ppp-partitions of genotype matrices.

#### Theorem

Introduction

Optimal ppp-partitions of genotype matrices can be computed in polynomial time.

#### **Algorithm**

- Build the following partial order:
  - Can one column be above the other in a phylogeny?
  - Can the columns be the two children of the root of a perfect path phylogeny?
- Over the partial order with as few compatible chain pairs as possible.
  - For this, a maximal matching in a special graph needs to be computed.

#### Summary

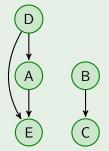

- Finding optimal pp-partitions is intractable.
- It is even intractable to find a pp-partition when just two noncontiguous blocks are known to suffice.
- For perfect path phylogenies, optimal partitions can be computed in polynomial time.

# The algorithm in action. Computation of the partial order.

#### Genotype matrix

	Α	В	C	D	E	
	2	2	2	2	2	
G:	0	1	2	1	0	
	1	0	0	1	2	
	0	2	2	0	0	

#### Partial order
